Cobb500™ Fast Feather

Management Supplement

2026

cobbgenetics.com

Table of Contents

Use the recommendations in this guide along with the Cobb Breeder Management Guide as aids to build your management program.

Management must meet the basic needs of the stock but also be optimized to attain the full potential of the breed. Our recommendations in this supplement are based on current scientific knowledge and practical experience and reflect the genetic potential of the Cobb hens based on Total Eggs and Hatch Percentage data collected from the top 25% of Cobb flocks worldwide.

This supplement should be used as a guide only and adapted locally according to your own experience when projecting performance from all flocks in a particular operation. You should be aware of any local legislation which may influence the management practices that you choose to adopt.

Cobb continues to expand the variety of breed crosses to meet global customer needs and expectations. Cobb technical representatives are always available for any questions and assistance.

Breeder Performance (Top 25% of Flocks)			
Age at 3% Production	(Weeks)	24	
	(Days)	168	
Peak Production	(%)	86	
Peak Hatchability	(%)	90	
Age at Depletion	(Weeks)	60	65
	(Days)	420	455
Total Eggs / Hen Housed		166.4	181.3
Hatching Eggs / Hen Housed	(50g minimum)	160.3	174.6
Cumulative Hatchability	(%)	86.2	85.6
Broiler Chicks / Hen Housed		138.2	149.5
Livability from 25 Weeks	(%)	91.0	90.0

For more technical information download the Cobb Breeder Management Guide at: https://www.cobbgenetics.com/resources

To maximize genetic potential

- Achieve good flock uniformity through careful flock management in rearing.
- Keep birds on the target body weight.
- Provide good quality feed.

Good Management Practices

- Follow Cobb feed recommendations. Research has shown that Cobb's recommended feed specifications have a positive impact on flock uniformity, fleshing, feathering, and performance.
- Provide ideal brooding conditions (feed, light, ventilation, bedding and water management) and closely monitor to ensure physiological requirements are met for optimum bird comfort.
- Adequate feeder space and flock uniformity are essential to achieve optimum performance. Inconsistent feed intake is the main cause of uniformity issues.
- Observe the flock during feeding as often as possible – weekly at a minimum. Ensure feed distribution of < 3 minutes with chain and pan feeders in the dark and correct feed space requirements.
- Use crop evaluations immediately after feed has been cleaned up (before drinking) to confirm that feed distribution is correct.
- Monitor daily water intake and provide adequate drinkers (maximum 10 birds / nipple or 75 birds / bell drinker).
- Biosecurity should always be top priority. Flock health is essential to achieve breed potential.

Rearing Essentials

- Please refer to Cobb Breeder Management Guide for general flock recommendations and uniformity management. Consistent flock uniformity >75 % is preferred during the rearing period to achieve proper condition prior to photo stimulation.
- Uniformity starts at placement. Achieve early body weight and uniformity target at 1, 4, 8, and 12 weeks of age.
- Establish a feeding curve to achieve +/-2% of the body weight standard during rearing. The feeding curve should be supported by the feed specifications and local conditions.
- To accomplish correct flock condition, it is important to achieve bodyweight and fleshing targets at 12, 16, and 20 weeks of age.
- Prevent over weight issues in the first 16 weeks of the rearing period.

* *Weights correspond to the weekly age based on the placement or hatch date. Between 2 to 22 weeks, weights should be taken when the crop is empty (dry BW) or at least 6 to 7 hours after the last feeding. Another option is to weigh the birds after the lights come on and before feeding takes place. Please consult with your Cobb technical representative for feed and light programs.*

† *Feed intake is developed based on Cobb feed specifications (see page 12) recommended for Cobb 500 females in their comfort zone (18-28°C, or 64-82°F).*

‡ *Nutrient requirements are determined by growth models combined with field data from the best performing Cobb flocks worldwide.*

- Feed intake is for guide purposes only and needs to be adjusted based on actual nutritional specifications to achieve the target BW and optimum conditions for the birds.
- Feed type: ST = starter, GR = grower, DEV = developer
- When daily feeding is done in rearing, the weekly feed amount can be increased by 2 to 3g from 5 to 14 weeks by using a lower density grower diet while maintaining the same nutrient intake/bird/day. This will help reduce stress and achieve more feed availability for proper feed distribution.
- Please refer to Cobb Breeder Management Guide for general flock recommendations and uniformity management. >75% flock uniformity (<9% CV) is preferred consistently during the rearing period to achieve proper condition prior to light stimulation.

Another option is to weigh the birds after the lights come on and before feeding takes place. Please consult with your Cobb technical representative for feed and light programs.*

† *Feed intake is developed based on Cobb feed specifications (see page 12) recommended for Cobb 500 females in their comfort zone (18-28°C, or 64-82°F).*

‡ *Nutrient requirements are determined by growth models combined with field data from the best performing Cobb flocks worldwide.*

- Feed intake is for guide purposes only and needs to be adjusted based on actual nutritional specifications to achieve the target BW and optimum conditions for the birds.
- Feed type: ST = starter, GR = grower, DEV = developer
- When daily feeding is done in rearing, the weekly feed amount can be increased by 2 to 3g from 5 to 14 weeks by using a lower density grower diet while maintaining the same nutrient intake/bird/day. This will help reduce stress and achieve more feed availability for proper feed distribution.
- Please refer to Cobb Breeder Management Guide for general flock recommendations and uniformity management. >75% flock uniformity (<9% CV) is preferred consistently during the rearing period to achieve proper condition prior to light stimulation.

FEED INCREASE PLAN

Week	Days of Age	Feed Increase Range (g/bird/day)
14	92 - 98	3 - 5
15	99 - 105	5 - 10
16	106 - 112	6 - 10
17	113 - 119	6 - 10
18	120 - 126	5 - 8
19	127 - 133	5 - 8
20	134 - 140	4 - 7
21	141 - 147	3 - 5
22	148 - 154	3 - 4
23	155 - 161	3 - 4
24	162 - 168	3 - 4
25	169 - 175	Based on production

- The feed amount is based on Cobb nutritional recommendations and for guide purposes only. Lower density feed requires higher feed increases.
- This feed increase plan applies to scenarios when birds are on target body weight or slightly below target at 16 weeks of age. Flocks with poor uniformity (<70%) may require higher feed increases.
- Extra feed increases should be considered during transfer, vaccination or when birds are experiencing stress.

PREPARING THE FLOCK FOR PHOTO STIMULATION

Week	*Fleshing Score*				*Pelvic Fat*
	# 2 (%)	*# 3 (%)*	*# 4 (%)*	*Total # 3+4 (%)*	*(%)*
12	70	30		30	
16	40	60		60	
19	<10	60	30	90	>65
20	<5	60	35	95	>75
21		60	40	100	>85
22		60	40	100	>90

- Light stimulation should be at 147 days (or 21 weeks) of age. If fleshing is considerably behind at 16 and 20 weeks, the target mixing (and lighting) should be delayed until 150 to 154 days. Bodyweight should increase 36% between 16 to 20 weeks to facilitate fleshing and pelvic fat deposition. Feed increases between 14 to 20 weeks should be accelerated to achieve the target weight, fleshing and fat deposition at lighting.
- The fleshing and fat scores at 19 and 20 weeks of age determine the correct age for lighting. All rearing data including the body weight curve, feeding curve, feed formulation, fleshing and pelvic fat scoring should be used to make this decision.
- It is essential for males and females to have sexual synchronization at mixing. If male maturity is ahead of the female, males can be moved or mixed 1 week later. Temporarily mixing fewer males (5 to 7%) is another option. Please refer to the Cobb male supplement for more information.

Feeding Pullets Into Lay

Hen Day (%)	Energy Intake		Feed Intake (g/bird/day)		Feed Intake (lb/100 birds/day)	
	kcal/bird/day	Range	Amount	Increase	Amount	Increase
5	330	320 to 340	118		26.0	
15	339	330 to 350	121	3	26.7	0.7
25	347	335 to 360	124	3	27.3	0.7
35	364	350 to 375	130	6	28.7	1.3
45	386	375 to 400	138	8	30.4	1.8
55	412	400 to 425	147	9	32.4	2.0
65	437	425 to 450	156	9	34.4	2.0
75	460	440 to 470	164	8	36.2	1.8

- Feed amounts are based on mash Breeder 1 feed. Pellet/crumble feed may require lower calorie intake and adjustments must be made accordingly (reduce energy intake by 5 kcal/lb (11 kcal/kg)).
- The feed amount is based on thermoneutral conditions (21 °C, or 70 °F, from 3 weeks of age). Consult with your local technical service representative when feeding in extreme climate conditions.
- If peak hen day production is expected to go above 86%, the peak feed plan can be extended for 1 to 2 weeks.
- Focus on hen daily body weight gains, daily egg weight changes, and feed clean up time to help determine the amounts and timing of feed reduction from peak feed amounts. Keep in mind that feed clean up time will vary depending on feed form, feeding system, house climate and other factors.
- Please refer to the Cobb Breeder Management Guide or contact your Cobb technical representative concerning post peak feeding.

Valine	%	72	75	75	75	75
Isoleucine	%	68	70	70	70	70

**If the energy level needs to be adjusted for local conditions, then all other nutrients (protein/amino acids) need to be adjusted at the same ratio.*

- The energy values are based on WPSA Apparent Metabolizable Energy adjusted for zero nitrogen balance (AMEn).
- The amino acid values are based on Standardized Ileal Digestibility (SID) assays.
- Add at least 0.75 to 1% fat or oil to Developer, Breeder 1 and Breeder 2 throughout the year in tropical and subtropical regions or during the hot summer months.
- The Cobb nutrient recommendations are based on mash feed. If crumble or pellet feed is provided, decrease the energy recommendations 20 to 40 kcal/kg.

Supplementary Vitamins and Trace Elements

		Starter / Developer / Males		Breeders in Production	
Nutrients	Unit	Per kg	Per lb	Per kg	Per lb
Added Vitamins in Finished Feed					
Vit. A (Maize Diets)	IU	11,600	5,273	14,500	6,591
Vit. A (Wheat Diets)	IU	12,400	5,636	15,500	7,045
Vit. D3	IU	3,840	1,745	4,800	2,182
Vit. E	IU	96	44	120	54.5
Vit. K	g	6.4	2.9	8.0	3.6
Thiamine (B1)	g	4.0	1.8	5.0	2.3
Riboflavin (B2)	g	14.4	6.5	18	8.2
Pantothenic Acid	g	17.6	8.0	22	10.0
Niacin	g	48	21.8	60	27
Pyridoxine (B6)	g	5.6	2.5	7.0	3.2
Folic Acid	g	3.2	1.5	4.0	1.8
Vit. B12	g	0.05	0.022	0.06	0.027
Biotin (Maize Diets)	g	0.40	0.18	0.50	0.23
Biotin (Wheat Diets)	g	0.48	0.22	0.60	0.27
Added Minerals in Finished Feed					
Manganese	g	120	55	120	55
Zinc	g	120	55	120	55
Iron	g	40 to 60	18 to 27	40 to 60	18 to 27
Copper	g	14 to 20	7 to 10	14 to 20	7 to 10
Iodine	g	2.5	1.14	2.5	1.14
Selenium	g	0.3	0.14	0.3	0.14
Suggested Minimum Inclusion in Finished Feed					
Choline	mg	1400	636	1400	636
Linoleic acid	%	2.0	0.91	2.0	0.91

IU = International units
Supplementary levels of vitamins and trace elements should always be reviewed to ensure total levels do not exceed those set in local legislation.
Inclusion levels for trace minerals are formulated based on inorganic forms. If using organic or chelated minerals, please contact the supplier for inclusion value adjustments.
